

# Fibroblast Growth Factors

The Fibroblast growth factor (FGF) family of proteins comprise of 23 related proteins. They signal through FGF receptors (FGFRs) and regulate a plethora of biological functions like cellular proliferation, survival, migration, and differentiation, wound healing, hematopoiesis, tumorigenesis, chronic inflammation, etc. Due to such a varied functionality, FGFs are used very often for in vitro research and therapeutic applications. The success of their use depends on their quality, i.e., their purity, activity and stability. BioVision is very pleased to house the highest quality FGF antibodies and proteins for your research needs. Our antibodies can be used reproducibly with multiple applications. Our proteins are exceptionally active, highly pure, flexibly sized and are available from Animal Origin Free (AOF) manufacturing conditions. Browse the lists below to select FGF proteins from both mammalian and bacterial sources in multiple versions of human, mouse and rat recombinants.
