Secondary antibodies can bind to primary antibodies or antibody fragments and offer significant advantages over directly labeled primary antibodies in target detection. By the sheer ability of multiple units of secondary antibody binding to a single primary antibody, they are capable of amplifying the target signal multifold and thereby increasing the detection sensitivity. BioVision is very pleased to offer an array of secondary antibodies for this very purpose. These secondary antibodies have been isolated from a variety of host species like **goat, rabbit, mice and sheep**. They are conjugated to commonly available probes like **HRP, FITC, TRITC, Cy3, Texas Red, AMCA, AP, Biotin**, etc. They can be used with colorimetric or fluorometric detection platforms.

These antibodies are compatible with numerous **detection, purification and sorting applications** as shown in the adjacent table. All these secondary antibodies are available in **convenient sizes and competitive prices**. Choose from the following list of secondary antibodies BioVision offers, to enhance your target signals.
